

Heatcondens®

The perfect solution for heat pumps

The Heatcondens® is perfectly suited for the correct treatment of the condensate resulting from the defrosting process of the heat pump indoors. The flood-like condensate flows first into the pre-tank for treatment. It is then transported to the desired location by means of a lifting unit.

Your benefits:

- Versatile range of application
The treatment capacity is a maximum of 10 litres per surge (eight times per hour) and can therefore be used with practically all heat pumps.
- Plug & Play installation
The condensate hose from the heat pump can be connected directly to the Heatcondens® and 5m of hose is supplied for the drain. In addition, the mains cable of the delivery lifting unit is mounted ready for connection with a plug.
- Reliable operation
Thanks to the integrated filter technology, the Heatcondens® not only conveys the condensate surge from heat pumps to the desired location, but also protects the lifting unit and thus guarantees trouble-free operation. The condensate flows cleanly and does not back up into the heat pump.

Our vision: From condensate to water

Powercondens® ensures the correct treatment of condensate from heating, ventilation and air conditioning units. The specialist develops and produces well-thought-out solutions, is on the cutting edge and thinks ahead. Together with its sales partners, its innovative solutions and high-quality products, Powercondens® protects man and the environment - reliably since 1999.

Our product range:

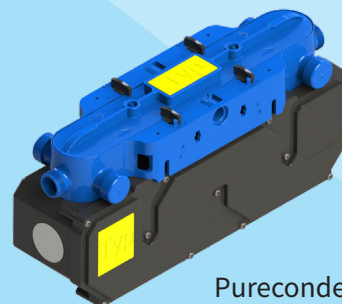

Heatcondens®

Boxcondens®

Wallcondens®

Purecondens®

Aircondens®

Climacondens®
